A Case of Infected Ingrown Toenail (treated with Homoeopathy and Pleomorphic Therapy)

Mrs. R came to me one day to request help for an ingrown toenail. She had not attended to it when it first effected her, and now it had developed into an infection, which was moving up her leg.

The homeopathic remedy, which is a specific for this problem, Magnetis polus Australis, was not readily available and had to be ordered. In the meantime, I began treatment with the Enderlein remedy, Notakehl. The patient also received daily bioactive frequency therapy, and sprayed the toenail several times a day with sub-nanometer colloidal silver.

After two weeks, the infection was visibly diminished, but the foot was still swollen and painful to walk on. By then the Magnetis polus Australis 30c had arrived, and Mrs. R was instructed to take one dose first thing in the morning. All other therapies were discontinued. Surgical intervention was not attempted.

After another three weeks, the foot was back to normal and there was no pain. The patient trimmed the toenail that had detached from the nail bed and wore a loose shoe. She did not lose the toe nail. No other treatment was required.
